

Be on the lookout for improper grounding and bonding connections to your gas meter

At D&H Gas Co., your safety is our number one priority. Whether it's a DIY project or through a contractor, customer-owned equipment, like generators and solar panels, should never be grounded or bonded to natural gas meters or any piping leading into or out of the meter. It can create a serious hazard, such as energized piping or natural gas leaks. If you notice ground or bond connections in the areas shown in the diagram, please contact D&H Gas Co.
